Acknowledgements

The South African Institute for Distance Education (SAIDE) wishes to thank those below:

For adapting and revising the module:

- Ingrid Sapire – writer
- Tony Mays – writer
- Commonwealth of Learning (COL) – for the OER instructional design template
- Andre Plant – for the illustrations
- Tessa Welch – project manager

For participation in preparing and piloting the module

- Judith Inglis (University of the Witwatersrand)
- Sam Kaferu / Nicholas Muthambi (University of Venda)
- Sharon McAuliffe (Cape Peninsula University of Technology)
- Ronel Paulsen / Barbara Posthuma (University of South Africa)
- Tom Penlington (RUMEP at Rhodes University)
- Thelma Rosenberg / Sally Hobden (University of KwaZulu-Natal)
- Ingrid Sapire (RADMASTE at the University of the Witwatersrand)
- Marinda van Zyl / Lonnie King (Nelson Mandela Metropolitan University)

For permission to adapt the following study guide for the module

For permission to use in Unit Five

How the unit fits into the module

Overview of content of module

The module Teaching and Learning Mathematics in Diverse Classrooms is intended as a guide to teaching mathematics for in-service teachers in primary schools. It is informed by the inclusive education policy (Education White Paper 6 Special Needs Education, 2001) and supports teachers in dealing with the diversity of learners in South African classrooms.

In order to teach mathematics in South Africa today, teachers need an awareness of where we (the teachers and the learners) have come from as well as where we are going. Key questions are:

Where will the journey of mathematics education take our learners? How can we help them?

To help learners, we need to be able to answer a few key questions:

- What is mathematics? What is mathematics learning and teaching in South Africa about today?

- How does mathematical learning take place?

- How can we teach mathematics effectively, particularly in diverse classrooms?

- What is ‘basic’ in mathematics? What is the fundamental mathematical knowledge that all learners need, irrespective of the level of mathematics learning they will ultimately achieve?

- How do we assess mathematics learning most effectively?

These questions are important for all learning and teaching, but particularly for learning and teaching mathematics in diverse classrooms. In terms of the policy on inclusive education, all learners – whatever their barriers to learning or their particular circumstances in life – must learn mathematics.

The units in this module were adapted from a module entitled Learning and Teaching of Intermediate and Senior Mathematics, produced in 2006 as one of the study guide for UNISA’s Advanced Certificate in Education programme.

The module is divided into six units, each of which addresses the above questions, from a different perspective. Although the units can be studied separately, they should be read together to provide comprehensive guidance in answering the above questions.
Unit 1: Exploring what it means to ‘do’ mathematics

This unit gives a historical background to mathematics education in South Africa, to outcomes-based education and to the national curriculum statement for mathematics. The traditional approach to teaching mathematics is then contrasted with an approach to teaching mathematics that focuses on ‘doing’ mathematics, and mathematics as a science of pattern and order, in which learners actively explore mathematical ideas in a conducive classroom environment.

Unit 2: Developing understanding in mathematics

In this unit, the theoretical basis for teaching mathematics – constructivism – is explored. Varieties of teaching strategies based on constructivist understandings of how learning best takes place are described.

Unit 3: Teaching through problem solving

In this unit, the shift from the rule-based, teaching-by-telling approach to a problem-solving approach to mathematics teaching is explained and illustrated with numerous mathematics examples.

Unit 4: Planning in the problem-based classroom

In addition to outlining a step-by-step approach for a problem-based lesson, this unit looks at the role of group work and co-operative learning in the mathematics class, as well as the role of practice in problem-based mathematics classes.

Unit 5: Building assessment into teaching and learning

This unit explores outcomes-based assessment of mathematics in terms of five main questions – Why assess? (the purposes of assessment); What to assess? (achievement of outcomes, but also understanding, reasoning and problem-solving ability); How to assess? (methods, tools and techniques); How to interpret the results of assessment? (the importance of criteria and rubrics for outcomes-based assessment); and How to report on assessment? (developing meaningful report cards).

Unit 6: Teaching all children mathematics

This unit explores the implications of the fundamental assumption in this module – that ALL children can learn mathematics, whatever their background or language or sex, and regardless of learning disabilities they may have. It gives practical guidance on how teachers can adapt their lessons according to the specific needs of their learners.

During the course of this module we engage with the ideas of three teachers - Bobo Diphoko, Jackson Segoe and Millicent Sekesi. Bobo, Jackson and Millicent are all teachers and close neighbours.

Bobo teaches Senior Phase and Grade 10-12 Mathematics in the former Model C High School in town;
Jackson is actually an Economics teacher but has been co-opted to teach Intermediate Phase Mathematics and Grade 10-12 Mathematical Literacy at the public Combined High School in the township;

Millicent is the principal of a small farm-based primary school just outside town. Together with two other teachers, she provides Foundation Phase learning to an average 200 learners a year.

Each unit in the module begins with a conversation between these three teachers that will help you to begin to reflect upon the issues that will be explored further in that unit. This should help you to build the framework on which to peg your new understandings about teaching and learning Mathematics in diverse classrooms.

How this unit is structured

The unit consists of the following:

- Welcome to the unit – from the three teachers who discuss their challenges and discoveries about mathematics teaching.
- Unit outcomes.
- Content of the unit, divided into sections.
- A unit summary.
- Self assessment.
- References (sources used in the unit).

In addition to this:

There is an additional reading for Unit Five. This reading gives additional mathematical content input in the area of Data Handling.
“After our last discussion,” said Bobo, “I took the time to really get to know my class. I identified one of my learners who in the past I had seen as a problem-child because he often did not do the work I set the class, or did not do it correctly or seemed not to participate. I realised that he had a hearing problem, which turned out to be tinnitus or ‘ringing in the ears’. He was not always following my instructions because he often did not understand them! Now I make much more use of the chalkboard and provide worksheets for him with all the instructions. Things are going much better with him now.”

“That’s good,” remarked Millicent. “If we are able to identify the cause of the problem then maybe we can come up with a solution. Sometimes it is easy. For example, one of my learners, Mosiuoa, broke his arm and it was in plaster. So for six weeks he could not write! I paired him with one of my other learners and allowed them to work out problems together. I accepted the written answers for class work, and even tests, as reflective of the work of both learners for that period. They still often work together even though Mosiuoa’s arm is better.”

“But sometimes it’s not that easy,” responded Jackson. “I think one of my learners, Faith Sedibe, is dyslexic or something. She is great at answering questions in class and seems to understand her own writing but when I
have to assess her work, everything seems back to front. I just don’t know how to mark her homework. And I don’t know how she’s going to cope with her end-of-year test.”

Think about the following:

1. Have you identified any learners in your class who have specific short or long term barriers to learning? Does your lesson planning include variations on activities for these learners?

2. What do you think of Millicent’s solution to assessing the work of Mosiuoa while his arm was broken? Do you think the results of this paired assessment would be reliable indicators of individual achievement? Which critical outcome is addressed by this approach?

3. What advice would you give to Jackson with respect to assessing Faith’s work?

Comments:

The following table, taken from p.16 of the policy document for inclusivity (DoE 2002), summarizes some of the possibilities for alternative ways to set up activities and assessment to help address different barriers to learning:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
In Jackson’s case, he needs to refer Faith to the School and/or Cluster and/or District-Based Support Teams for diagnosis and support for her apparent difficulty and, of course, the process must at all levels involve ongoing consultation with Faith and her parents. In the meantime, and within his own classroom, Jackson could sometimes make use of Millicent’s strategy of pairing Faith with another learner who does the recording of their combined thinking. However, Jackson also notes that Faith usually answers well orally. So sometimes it would be worth sitting down with her individually and getting her to talk through her reasoning. This would help Jackson to differentiate reasoning errors from transcription errors.

### Unit outcomes

Upon completion of Unit Five you will be able to:

- Explain the term assessment
- Identify four purposes of assessment
- Explain the principles of outcomes-based assessment (OBA)
- Describe the role and purpose of assessment in mathematics
- Implement a variety of types of assessment in assessing your learners’ performance in mathematics
- Identify and explain the aspects of mathematics learning you ought to consider when assessing learners
- Reflect on the assessment potential of mathematical tasks used in the teaching of basic data handling concepts
- Select appropriate methods, techniques and tools for assessing a learner's performance in mathematics
- Draw up or design your own assessment tasks and rubrics to be used when assessing a learner's work
- Compare various methods of recording a learner's performance.
Introduction

In our discussion of the term ‘assessment’, we will take into account the perspectives embodied in the principles of outcomes-based education (OBE), as implemented in South Africa. In this unit we analyze the purposes of assessment and give an overview of the main types of assessment and their use or function in classroom practice within the framework of OBE.

Assessment occupies a central place in education and especially in the mathematics curriculum. When assessment is done well, it empowers everyone because it:

- informs learners about what they have learned, what they have still to learn and how best to learn it;
- informs teachers about how to instruct or teach more effectively;
- informs parents about how best to support their child's learning.

When done poorly, however, assessment can lead to a misrepresentation of learning outcomes and thereby result in superficial teaching and learning. Thus, assessment should be an integral part of teaching and learning which functions as a quality assurance mechanism to ensure good teaching and learning practice.

The idea that assessment can and should contribute constructively to the curriculum has led to some debate and controversy about the nature, role, importance and the place of assessment in education. One view is that there is a need for new assessment practices to complement more traditional, widely used techniques. These new assessment practices ought to:

- take into account the current curriculum, content and goals
- inform teaching initiatives in terms of achieving outcomes
- comply with national and institutional policies.

Pegg (2002: 227) states that assessment should always be sensitive to the learner's cognitive development. For example, if you have just finished teaching your learners how to add four digit whole numbers to five digit whole numbers, it would not be fair to give them an assessment task that only includes addition and subtraction of numbers with several decimal places. This will not give them the opportunity to show that they have grasped the addition process they have just been working with. You may wish to add one or two questions to the end of the assessment task (on adding four digit whole numbers to five digit whole numbers) which allow learners to show that they can apply their understanding of adding numbers with different place values to a range of numbers. To realize the
positive potential of assessment in our classrooms, we need a clear idea of:

- why we are doing assessment in the first place
- what it is we are assessing
- how best to go about it.

After reading this unit you will be aware that assessment is more than a set of tests or assignments. Assessment has a purpose and we need to establish the purpose of assessment in order to design an appropriate assessment programme that will enable us to achieve our goals. This unit will elaborate on:

- how the purpose of assessment has changed in the new curriculum
- four main purposes of assessment in SA’s educational system.

We will give an illustration of baseline assessment tests used to establish the readiness of learners to measure items using standard units of measurement.

All of the material in the earlier units of this guide has suggested that teaching in accordance with the NCS will result in learner-centred teaching. This style of teaching will assist learners to develop their reasoning skills and their ability to solve mathematical problems both in and out of real contexts. The diverse classes that many teachers have to face will also benefit greatly from learner-centred teaching, which will be able to address individual needs where appropriate. Assessment which is not in line with good teaching methods could undermine the value and benefits of that teaching. It is thus essential that the assessment approach you use should support your teaching methods.

Much of the mathematical content used to illustrate and work with the assessment ideas put forward in this unit will come from LO5 (Data Handling). This will give you the opportunity to think about setting tasks that support sound mathematical teaching. We will look at the difference between assessment methods, techniques, and skills. Most importantly we will show that you must relate the purpose of the assessment with what is being assessed. You need to think about what, how and why you assess, how you interpret the results of the assessment and how you will respond to the learners and engage stakeholders in the process.

The following quotation from Assessing Students: How shall we know them? (Derek Rowntree, 1997, Kogan Page, p.11) will serve as a framework for this unit.
Why assess?

Deciding why assessment is to be carried out; what effects or outcomes it is expected to produce.

What to assess?

Deciding, realizing, or otherwise coming to an awareness of what one is looking for, or remarking upon, in the people one is assessing.

How to assess?

Selecting, from among all the means we have at our disposal for learning about people, those that we regard as being most truthful and fair for various sorts of valued knowledge.

How to interpret?

Making sense of the outcomes of whatever observations or measurements of impressions we gather through whatever means we employ; explaining, appreciating, and attaching meaning to the raw ‘events’ of assessment.

How to respond?

Finding appropriate ways of expressing our response to whatever has been assessed and of communicating it to the person concerned (and other people).

Rowntree’s points are very much in line with the RNCS for Mathematics for grades R-9, (DOE 2002:93), which states that

> Assessment is a continuous, planned process of gathering information about the performance of learners measured against the Assessment Standards (ASs) of the Learning Outcomes (LOs). It requires clearly defined criteria and a variety of appropriate strategies to enable teachers to give constructive feedback to learners and to report to parents and other interested people.

As this unit unfolds, it will assist you in meaningfully interpreting and applying this RNCS definition of assessment.

Why assess?

Assessment is an integral part of our daily lives. Every time we have to make a decision, we have to, for example, **assess, value, judge, estimate, appraise**, the situation first before we can go any further. To assess means to measure.
Activity 1

For this activity you need not think of assessment in the context of a mathematics class. Think of it broadly as you experience it or have seen others experience it in everyday life.

1. What ideas about assessment come to mind in your personal experience? Write down some of the ideas.

2. Reflect on the uses of assessment in everyday life. Write down some of the uses that you think of and the impact they have on the individuals being assessed.

3. Discuss what each of the following ideas signify to you in the context of assessment:

<table>
<thead>
<tr>
<th>evaluate</th>
<th>appraise</th>
<th>estimate</th>
<th>competition</th>
</tr>
</thead>
<tbody>
<tr>
<td>tests</td>
<td>examinations</td>
<td>fail</td>
<td>pass</td>
</tr>
<tr>
<td>study</td>
<td>poor marks</td>
<td>stress</td>
<td>worried</td>
</tr>
<tr>
<td>motor-vehicle test</td>
<td>doctor’s report</td>
<td>sports coaching</td>
<td>success</td>
</tr>
</tbody>
</table>

The purposes of assessment in outcomes-based education

Your own experience of assessment will have an influence on the way in which you set about assessing your learners. This experience may or may not have features common to those we would like to see emerging in OBA (outcomes-based assessment). The key features of OBA are the following:

- **Outcomes-based assessment** (OBA) should assist learners to reach their full potential - it should be developmental rather than judgmental.

- Teachers should assess learners to determine what they **know**, **understand**, **can apply** and **can do**, and to provide learning experiences that lead to higher levels of performance by learners.

- OBA should involve learners actively in using the relevant knowledge in real-life contexts to make sense of the world and to construct meaningful links between the skills, knowledge, concepts, processes, attitudes and values (outcomes) covered. This principle is embodied in the NCS in its **critical outcomes**, from which the learning outcomes and assessment standards were developed.

- OBA should be **integrated** into the **teaching and learning process**. Effective assessment and recording comes from integrating assessment planning into curriculum planning, phase and programme planning and classroom activity plans (lesson plans).

The four purposes of assessment given below call for assessment methods and techniques that are varied to suit the purpose of the assessment.

**Baseline assessment** is used to measure learners' existing ideas, knowledge, experiences and skills. It is used at the beginning of a new set of learning activities to determine what the learner already knows (i.e. recognition of prior learning [RPL]). It is used to assist in determining
what levels of demands to build into the learning plan. Baseline assessment is not always formally recorded, but occasionally takes the form of standardized tests such as ‘readiness tests’ for school beginners. It is used to enable teachers to identify learners with special needs early on in the learning programme. This assessment can be based on teacher judgment or objective assessment, for example the teacher develops tests to determine the range of ability amongst learners. Another aspect of baseline assessment is that it can involve the interface between teacher and parents when collecting information or when providing feedback.

Formative assessment is assessment of learning which results in process evaluation. It allows teachers to inform the learner and to plan future learning. Formative assessment should involve a developmental approach. It can be formal or informal. It is designed to monitor and support learning progress, and should occur throughout the learning process. Formative assessment involves both the teacher and learner in a process of continual reflection and reviewing of progress, and helps the teacher to determine the learners’ strengths and needs. It provides quality feedback to empower learners to take appropriate action and allows teachers to adjust the learning/instruction process according to the response to formative assessment. As such has it the potential to have the greatest impact on learning. It can be done by the teacher, learner, peer group and parents. The quality of formative assessment is determined by evaluative feedback in order to achieve improvement. An accumulation of formative assessment tasks can be used for summative purposes.

Your experience of assessment may have been very much test-based. Tests can be formative, if the teacher can use the tests to analyze where learners are and provide specific, focused feedback to the learners based on the tests. The teacher should set frequent short tests rather than infrequent long tests, and guidance can be provided. If more serious or extensive learning problems are diagnosed (through formative assessment) these should be addressed. Formative assessment should test new learning soon after the lesson/theme/topic has been completed.

Diagnostic assessment is specifically focused on uncovering the nature and cause of a learning problem and providing appropriate support and guidance. It can guide the teacher so that appropriate support can be given and would determine whether specialist advice and support should be requested.

Summative assessment is assessment of learning in a holistic context. It is carried out at the end of a learning programme, unit, theme, term, year or grade. Summative assessment provides an overview of the learner’s overall progress. It allows the teacher to make a judgement about the learner’s performance in relation to a particular standard. It provides valuable data records that can be used for various management purposes (e.g. transfer to other school, scholastic progress for further studies, information for selection and certification purposes etc.). Summative assessment also determines how well a learner has progressed towards the achievement of specific outcomes and in this way facilitates feedback to the learner. Summative assessment should encompass a series of assessment activities which result in an overall report on the performance of the learner. It is usually done by the teacher or specialist. It is
reasonably formal, for example tests and examinations are often the means for performing summative assessment.

Assessment in OBE quite naturally takes the form of what is known as continuous assessment (CASS).

**Continuous assessment**

<table>
<thead>
<tr>
<th>Activity 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Why do you think that assessment for OBE ‘quite naturally’ takes the form of continuous assessment?</td>
</tr>
<tr>
<td>2 Is continuous assessment the same as formative assessment?</td>
</tr>
<tr>
<td>3 Can continuous assessment be used summatively? Can the results of various tests and assignments and investigations in the course of the year be added to create a global assessment of whether or not the learner has achieved the required set of outcomes at the required level?</td>
</tr>
</tbody>
</table>

Continuous assessment is ‘natural’ for OBE, because the philosophy of OBE is that learners are on a journey of lifelong learning. As they journey, they will learn the values, attitudes, skills and knowledge that they need to achieve the goals they set for themselves in life. Learners will not only learn things at school. The outcomes, set out in the curriculum documents, speak about certain values, attitudes, skills and knowledge that learners can achieve through the schooling they will receive. It is the responsibility of teachers to ensure that they do indeed achieve the outcomes, as they have been expanded on, grade by grade, as they progress through school.

It is in the nature of outcomes that they will be achieved at different rates by different learners according to factors such as the situation they find themselves in and their individual ability. This achievement will be facilitated by ongoing – formative – feedback, which can be given if assessment is carried out on a continuous basis, using a variety of methods. Learners should be given several opportunities to show that they are progressing in the achievement of the learning outcomes. A policy of continuous assessment facilitates the formative use of assessment.

To rely on a final high stakes test/examination at the end of a learning process may not allow all learners to demonstrate the range of skills they have developed, and the stages of their progression. Continuous assessment gives you the opportunity to vary the kind of assessment you are using because you assess the learners a number of times and in different ways. The results of all these ways can be used in the final (summative) assessment of learners’ achievement.

The use of an integrated assessment task – the kind of assessment task that measures across LOs in the performance of an authentic real-life task – could also contribute towards an overall continuous assessment programme.

In summary, continuous assessment embraces all four of the purposes of assessment described above – baseline, diagnostic, formative and summative – and supports the philosophy of OBE.
When to assess?

The simple answer to the question, ‘When should assessment take place?’ is that assessment should be ongoing and continuous. But the purpose of the assessment at different points in teaching and learning will be different.

Assessment before teaching and learning

Before beginning a unit of study one has to determine what the learners already know about what is to be taught, and inform them of how they will benefit from what they are about to learn. Secondly one has to determine the prior knowledge that the learner has already acquired in relation to the current topic.

Assessment during teaching and learning

During the lesson, one should do ‘in-process assessment’ (also known as ‘feedback’ or ‘formative assessment’). This is important as it provides information on the learner's progress on an ongoing basis. It also indicates to teachers and learners what outcomes have or have not been attained and is used in order to plan follow-up teaching and learning. Performance indicators or assessment standards provide criteria for making a judgment about learning and are used as benchmarks in assessing achievement. The following three levels of achievement may be evaluated during this process:

- Learners show no evidence of having an understanding or skill.
- Learners are developing an understanding or skill.
- Learners have developed an understanding or skill.

Assessment after teaching and learning

During this phase, assessment is undertaken at specified times after teaching and learning have taken place. The learners' achievements are then communicated to them, their parents and the school personnel. This type of assessment can be classified as **summative assessment** since it provides information about the achievements of outcomes that can be compared with the assessment standards. Sources of obtaining summative data include in-process assessment, portfolios, assignments individual or group projects, tests, etc. New directions in teaching mathematics (as in OBE) rely less on norm-referenced evaluation and more on outcomes that focus on all learners attaining important mathematical knowledge.

An example of assessment before teaching and learning

An interesting example of the way assessment can be used before teaching and learning is found in the conservation tests of the Swiss educational psychologist, Jean Piaget. In this section we refer to the tests
he devised to assess a learner’s progress in acquiring fundamental measurement concepts. He stated that unless a learner has a clear concept of conservation (constancy or invariance) of length, area, or volume, it is no use teaching him about how to measure these things. The tests he developed (called conservation tests) were diagnostic tests to be carried out before the teacher proceeds with teaching learners how to use measuring instruments.

Measurement is important because of its power to help learners see that mathematics is useful in everyday life. Learners need to be able to differentiate between perimeter and area. They should also be able to compute the area and perimeter of polygons and other shapes. The topic of measurement can be used extensively for problem solving through multiple entry points to accommodate the diversity of learners in a classroom. Multiple entry measurement activities will encourage learners to investigate and to use their own level of reasoning and understanding. They also allow for differentiation, both in the completion of the activity and in the assessment of the activity. This is very useful to teachers working in diverse classrooms.

Even an adult’s concept of amount can be faulty. For example, sometimes as adults we are surprised to find that our coffee mug does not hold more coffee than an ordinary tea-cup. We think that, simply because it is taller, it must hold more. Piaget found that concepts are attained in a particular order, and gave approximate ages for their attainment. However, some learners are very late in forming concepts, so you should not assume that an 11-year old has attained the concept of conservation of area, for example. You have to test for the achievement of the concept, which can be done very quickly as you will see below.

Before we teach learners to measure an amount, they should have attained the concept of conservation (invariance) of that amount, even when the appearance has been distorted. The attainment of the concept is a matter of development and a learner is not ready to measure an amount if he or she believes it to be bigger at one time and smaller at another.

The tests proceed as follows, and the teacher must be very careful not to ask leading questions which could prompt the correct answer.

1. The learner looks at equal amounts, A and B. He is asked which is more, A or B. The learner states that A and B are the same.

2. The appearance of the thing with amount B is distorted. The learner is asked if amounts A and B are the same, or different; (and not the suggestive question ‘Which is more?’)

3. If the learner says that the amounts A and B are still the same, distort further.

   If the learner continues to say A and B are the same, the learner has attained the conservation concept.

   If the learner can explain that amount B is the same as amount A because you can restore the thing with amount B to its original appearance, he or she has the concept of reversibility.
If the learner says amounts A and B are not the same, ask which is more.

4 The learner believes what he or she says; it is the learner’s truth at this stage of his or her development. Reasoning will not persuade the learner differently if he or she has not attained the concept of conservation of this quantity. If this is the case, the learner needs to do more practical work comparing quantities, until the concept is understood.

Following are illustrations of the conservation tests for length, area and volume (French: 1979).

**Conservation of length**

*Test 1*

Materials: 2 unsharpened pencils of the same colour.

Give these to the learner and ask if the pencils are the same length. If the learner says yes, place one pencil to the left of the other and ask again if the pencils are the same length. If he or she says yes, change the position of one of the pencils and repeat the question.

Try this with the pencils in several positions.

Ask the learner why he or she is sure.

If the learner says no, ask him or her to point to the longer one.

Repeat the test with other objects of equal length.

*Test 2:*

Materials: 2 pieces of string of equal length.

Follow the procedure in Test 1.

One piece of string can be curved, or cut.
Conservation of area

Test 1

Materials: 2 postcards of the same size, on the table.

Ask the learner if the postcards cover exactly the same area of the table surface. If the learner says yes, tear one postcard in two, and place both pieces, moved apart from each other, on the table. Ask the learner whether the two pieces cover the same area of the table as the whole card covered.

If the learner says yes, tear each of the two pieces of card in half and place all four pieces, apart from each other, on the table and repeat the question.

If the answer is yes, tear the four pieces in half, so that there are eight pieces, and repeat the question. Ask the learner why he or she is sure of the answer.

Test 2

Follow the procedure in Test 1.

Keep one postcard for comparison, while other postcards are cut up and the pieces placed together to form new shapes.

Test 3

Materials: 2 congruent sheets of paper (green if possible); at least a dozen congruent cubes; 2 toy horses.

Place one horse on each sheet of paper, which represents a field of grass. Ask: Has each horse the same amount of grazing?

Each farmer begins to build. (Place one cube on each sheet of paper.) Ask: Has each horse the same amount of grazing now?

Ask this question as another building, and another, and another … is put up. (Place the cubes close together on one sheet of paper, and scatter them over the second.)

If the learner states each time that the horses have the same amount of grazing, ask why he or she is sure. He or she may be able to explain that each farmer started with the same amount of grass, that they have built the same number of buildings, and therefore have the same grass left. If this is the case, the learner has attained the concept of conservation of area.

If the learner says no at any stage, provide further experience to develop the concept.
Conservation of volume (and capacity)

*Test 1*

Materials: 2 congruent balls of plasticine (equal volumes).

Let the learner see that these have the same volume.

Roll one ball into another shape, such as a long ‘snake’.

Ask the learner if the two shapes have the same amount of plasticine.

If the learner says yes, break up the ‘snake’ into several small balls and repeat the question.

If the learner says yes, ask why he or she is sure.

If the learner says no, further experience is necessary to develop the concept.

(This experiment can also be used to test for conservation of mass. Compare the original masses on a balance.)

*Test 2*

Materials: 2 similar glasses containing equal volumes of cold-drink, several other containers, wide and shallow, tall and thin.

The learner agrees that the two glasses contain the same amount of cold-drink. Pour the contents of one glass into another container and ask if it contains the same amount of cold-drink as the other glass. Follow the usual questioning procedure.

*Test 3*

Materials: At least 24 congruent cubes.

Make a shape using a certain number of cubes. Ask the learner to make a copy of the shape. Ask whether your shape or the learner’s shape takes up (or fills) the same amount of space. If the learner says yes, rearrange your cubes to form a different shape, and repeat the question.

Continue questioning, making other shapes, and using more cubes.
Activity 3

Applying conservation tests

How would you use the conservation tests in the box above in your teaching of measurement in the intermediate phase?

Describe a lesson where you use one (or more) of the conservation tests.

1. Write down your observations on learners who have achieved an understanding of conservation of the concept you chose.

2. Write down your observations on learners who have NOT achieved an understanding of conservation of the concept you chose.

3. What will you do to help the learners who have NOT achieved an understanding of conservation of the concept you chose?

As we have said above, ‘it is in the nature of outcomes that they will be achieved at different rates by different learners according to factors such as the situation they find themselves in and their individual ability.’ It is easy to say this in theory, but more difficult in practice.

When it comes to teaching measurement, there are five stages that are usually followed and there needs to be assessment at each stage – to establish readiness to move to the next stage. It is important to know the purpose of each stage, so that you assess the correct thing.

Stage 1: Readiness

You won’t be able to teach measurement at all if your learners do not have a grasp of the basic conservation concept. Piaget’s conservation tests will help you assess readiness.

Stage 2: ‘How much’

At this stage, learners practise measuring the size of a ‘thing’ using an arbitrary ‘standard’ (a piece of the same kind of ‘thing’ having an arbitrary unit size). Learners should compare directly — they should have a ‘standard’ object, and they should count how many ‘standard’ objects make up the object whose size is being measured. They should be trained to give the measurement correct to the nearest unit.

Through incidental learning, the principle of measurement is established and the activity of measurement practised. At this stage, the result of the measurement is unimportant; it is the activity which counts.

Stage 3: The necessity for a widely accepted standard and unit is established

At this stage, a mental image of the unit size is established by estimation and then by measurement.

Learners love measuring, especially ‘themselves’ — their heights, their masses, length of feet, circumference of waists! You can play around with the idea of a standard unit by, for example, using their (small) hands to
measure something, and your (larger) hand to measure something – and then seeing how different the measurement results are.

Stage 4: Measurement, followed by computation

Here you get to down to the business of measurement and calculation by, for example, finding the mass of one brick and then calculating the mass of 10 bricks. Unless you have gone through the previous stages, learners will simply do calculations mechanically, without understanding.

Stage 5: Computation with physical quantities

Finally, all units and conversions between units can be used.

What to assess?

We have already established in the earlier units of this guide that outcomes-based education (OBE) is an approach to teaching and learning which stresses what learners are expected to achieve. In OBE, the teacher states in the beginning the performance expected of the learners - this is an outcome. The teacher's task is to teach in order to support or help the learners to achieve the outcomes stated in the curriculum, and the learners' task is to achieve the expected outcomes. Assessment is essential to OBE because

- The teacher is able to measure to what extent a learner has achieved each outcome;
- Curriculum-development requires assessment to control whether the curriculum is being implemented successfully.

Assessing outcomes

We now need to think more specifically about what to assess in our mathematics classes. Within the framework of the NCS, the Critical Outcomes (COs), Developmental Outcomes (DOs), Learning Outcomes (LOs) and Assessment Standards (ASs) serve as the basis for assessment as follows:

- **The Critical Outcomes (COs)** are a list of outcomes that are derived from the Constitution and are contained in the South African Qualifications Act of 1995. They describe the kind of citizen that the education and training system should aim to create. There are seven critical outcomes. The COs give the goals (outcomes) we are all in the process of working towards in the process of life-long learning.

- **The Developmental Outcomes (DOs)** are a list of outcomes that are derived from the Critical Outcomes. There are five Developmental Outcomes. The DOs give more clarity on the steps towards the achievement of the COs in the learning process.
A Learning Outcome (LO) is derived from a particular CO and is a description of what (knowledge, skills and values) learners should know, demonstrate and be able to do at the end of the General Education and Training (GET) Band. A set of LOs should ensure integration and progression in the development of concepts, skills and values through the ASs. LOs do not prescribe content or method as stated in the overview to the RNCS (2002: 14).

Assessment Standards (ASs) describe the level at which learners should demonstrate their achievement of the particular LO and the ways (depth and breadth) of demonstrating their achievement. An AS is grade specific and shows how conceptual progression will occur. It embodies the knowledge, skills and values required to achieve a particular LO. An AS does not prescribe a specific method. According to Chisholm (2000: 90), learning outcomes and assessment standards should be seen as covering the minimum of the core concepts, content and values that should be covered in each grade in each learning programme.

The Critical Outcomes and Developmental Outcomes
(The Overview, National Curriculum Statement Grades 10 – 12 (GENERAL), page 7)

Outcomes-based education (OBE) forms the foundation for the curriculum in South Africa. It strives to enable all learners to reach their maximum learning potential by setting the Learning Outcomes to be achieved by the end of the education process. OBE encourages a learner-centred and activity-based approach to education. The National Curriculum Statement builds its Learning Outcomes for Grades 10 – 12 on the Critical and Developmental Outcomes that were inspired by the Constitution and developed through a democratic process.

The critical outcomes require learners to be able to:

1 Identify and solve problems and make decisions using critical and creative thinking;
2 Work effectively with others as members of a team, group, organisation and community;
3 Organise and manage themselves and their activities responsibly and effectively;
4 Collect, analyse, organise and critically evaluate information;
5 Communicate effectively using visual, symbolic and/or language skills in various modes;
6 Use science and technology effectively and critically showing responsibility towards the environment and the health of others; and
7 Demonstrate an understanding of the world as a set of related systems by recognising that problem-solving contexts do not exist in isolation.

The developmental outcomes require learners to be able to:

8 Reflect on and explore a variety of strategies to learn more effectively;
9 Participate as responsible citizens in the life of local, national and global communities;
10 Be culturally and aesthetically sensitive across a range of social contexts;
11 Explore education and career opportunities; and
12 Develop entrepreneurial opportunities.
The outcomes given and referred to above may seem vague, but you will notice that they become more specific as you go down the levels. By expressing outcomes as actions and performances that embody and reflect learner competence in using ideas, information, content and skills, the curriculum emphasises that learners are able to do important things with what they know and are able to link it with real life experiences. This implies that you cannot assess learners unless they do something to reveal their understanding (or lack of it).

Thinking about outcomes can provide a teacher with a clear focus and structure for his or her lessons. Teachers should communicate those desired outcomes to learners - if they know what the teacher wants them to achieve, they will have a better chance of achieving it.

According to the RNCS for Mathematics for grades R-9, (DOE 2002:93)

Assessment is a continuous, planned process of gathering information about the performance of learners measured against the Assessment Standards (ASs) of the Learning Outcomes (LOs). It requires clearly defined criteria and a variety of appropriate strategies to enable teachers to give constructive feedback to learners and to report to parents and other interested people.

---

**Activity 4**

The paragraph above from the RNCS gives concise but detailed guidance to the teacher about OBA. Give explanations of the following words or phrases taken from this definition. The explanations should expand on the meaning of the word/phrase in its context above.

Your explanations can draw on your experience as well as the information you have gathered from the material in this guide. For some of the ideas you may wish to look ahead to the end of this chapter.

1. continuous
2. planned
3. process of gathering information about the performance of learners
4. measured against the Assessment Standards (ASs) of the Learning Outcomes (LOs)
5. requires clearly defined criteria
6. variety of appropriate strategies
7. enable teachers to give constructive feedback to learners
8. enable teachers to report to parents and other interested people.
Assessing for reasoning, understanding, and problem solving

The broad view of assessment that underpins the RNCS is seldom part of the assessment process in mathematics. Instead, assessment is often dominated by

- a focus on content (in the form of facts)
- a focus on skills (associated with computational techniques)
- the ability of learners to reproduce these on demand.

This narrow focus has had a sterile effect upon innovation and development in mathematics curricula and even on what thinking mathematically means. Learning programmes that provide for limited developmental work, that place an emphasis on symbol manipulation and computational rules, and that rely heavily on paper-and-pencil worksheets do not fit in with the natural learning patterns of learners and do not contribute to some important aspects of learners' mathematical development.

Take the following worksheet on basic operations as an example.

**Operations Worksheet**

Use your slate/whiteboard/rough paper to do any working you need to do.

1. Calculate the following. Then give your answers:
   - 34 + 56 =
   - 27 + 18 =
   - 40 + 26 =
   - 15 + 69 =
   - 18 + 72 =
   - 38 + 43 =
   - 29 + 39 =
   - 59 + 46 =
   - 37 + 27 =
   - 69 + 13 =

2. Give answers to the following questions:
   - 34 + 56 =
   - 27 + 18 =
   - 40 + 26 =
   - 15 + 69 =
   - 18 + 72 =
   - 38 + 43 =
   - 29 + 39 =
   - 59 + 46 =
   - 37 + 27 =
   - 69 + 13 =
This worksheet simply has twenty repetitive addition and subtraction questions. There is no discussion on different methods that could be used, and no indication that working is worth recording. The ultimate purpose of doing this worksheet is to ‘give answers’. This does not convey the message to the learners that their reasoning process is important to the teacher, only that their answers are important. This goes against the ethos of teaching for meaningful understanding. Using a worksheet such as this one would undermine good teaching because it gives a message that contradicts what we have said about good teaching.

- It does not allow for the development of reasoning skills (there is not even one little question which could call on reasoning skills).

- It does not allow learners to show what they have understood (or more importantly NOT understood). If learners get the wrong answer, that is that. There can be no investigation as to where they went wrong, because only answers are being considered.

- Problem solving is not present here. The questions are not grouped (as they potentially could be) so that patterns could be identified as an aid to doing the calculations. Identifying patterns is an important problem-solving technique that can be introduced at this level, since it is effective and appropriate as a strategy for learners to use when they move from simple bonds to addition and subtraction of bigger numbers.

The activities that you set should allow learners to develop the knowledge and skills set out in the Assessment Standards for their grade. The main lesson about good mathematics teaching is that it should develop reasoning, understanding, and problem solving.
Comment on the task below, by answering the questions that follow after it.

**Pizza Problem**

1. Complete the next two rows in the following pattern, which is known as Pascal’s triangle.

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>1</td>
<td>3</td>
<td>3</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>4</td>
<td>6</td>
<td>4</td>
<td>1</td>
</tr>
</tbody>
</table>

2. Pizza Palace has asked you to design a form to help them to keep track of certain pizza choices. The basic pizza, which everyone has, is cheese and tomato. Patrons can select extra toppings which they like. The toppings they can choose are: Peppers, Olives, Sausage, Salami, and/or Mushroom. They can choose as many of the extras as they like.

- List all of the possible choices they have, given the above selection.
- Find a way to convince somebody else (without doubt) that you have accounted for ALL possible choices.
- How many different choices for pizza at the Pizza Palace does a customer have?

i. In what way does ‘the pizza problem’ allow learners to develop their reasoning skills?

- Write out an example of a question (or a part of a question) from the task that allows for the development of reasoning skills.
- What evidence of reasoning skills (or lack thereof) will the teacher be able to find in the learners’ work that they submit having completed this task?

ii. In what way does it allow learners to develop their understanding?

- Write out an example of a question (or a part of a question) that allows for the development of understanding.
- What evidence of understanding (or lack of understanding) will the teacher be able to find in the learners’ work that they submit having completed this task?

iii. In what way does it allow learners to develop their problem-solving skills?

- Write out an example of a question (or a part of a question) that allows for the development of problem-solving skills.
- What evidence of problem-solving skills (or lack thereof) will the teacher be able to find in the learners’ work that they submit having completed this task?
Although the quantitative (such as content and computational skills) aspects of mathematics learning have dominated the school scene for a long time, it is the qualitative considerations that have greater significance. Thus, it is far more important that learners come to understand mathematical ideas than that they possess a wide array of mathematical skills. Mathematical learning is not only dependent on learners’ attitudes towards and decisions about learning mathematics but also depends on the intellectual, social and affective dimensions of learning, and these must all influence curriculum and instruction.

Reflecting on what to assess through the teaching of data handling

We will now examine the use of assessment for different purposes in the context of LO 5: Data Handling. The material in the Reading for Unit Five, Exercises in teaching data handling emphasizes some of the fundamentals of data handling. It comes from the RADMASTE (2006) ACE materials.

<table>
<thead>
<tr>
<th>Activity 6</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Teaching and assessing data handling</strong></td>
</tr>
</tbody>
</table>

Read and work through the mathematical information and five exercises on data handling in the Reading for Unit Five: Exercises in teaching data handling. As you work through the examples, think about the different mathematical competences that are being developed and assessed in the activities.

Once you have worked through the main skills of data handling – collecting data, representing data, and interpreting data – and looked at the sample exercises that you could use with learners, consider what this means for assessment.
Reflection on Exercises in teaching data handling

1 Reflect on each of exercises 1 to 5 by answering the following questions.

Refer to a copy of the RNCS to find the appropriate curriculum references where necessary. Explain all of your answers.

- Which AS (from LO 5 Data Handling) do you think this exercise could address, and for which grades do you think it would be appropriate? [Some exercises could be used for several grades, while others could not.]

- Which of the questions in the exercise simply ask for memorisation?

- For the purposes of OBE/OBA, are simple memorisation tasks useful, and if so where?

- Which of the questions in the exercise call for routine procedures that require no explanation or ambiguity?

- Which of the questions in the exercise call for procedures in order to develop deeper levels of understanding?

- Which of the questions in the exercise require the learner to analyse the question and think about the solution before proceeding?

2 Which exercises call for group activity or could be used for group work, even if this is not indicated?

Look back over all of the exercises and decide which of them deal with concepts and procedures, which of them deal with processes and which of them deal with the learner’s disposition.

As a teacher, you need to be able to decide what aspects are being addressed in the different activities, exercises and assessment tasks that you set. When you plan your teaching programme, you need to ensure that you provide a good mix of activities for your learners. You will need to examine the text book that you use in your mathematics classes (especially if you make regular use of a text book) to satisfy yourself that it provides a balanced set of activities that address all of the things you need to teach and assess your learners on.

How to assess?

In this section we deal with the question of how to assess. Assessment is the process of collecting and interpreting evidence in order to make a judgment on a learner's achievement and competencies. Evidence can be collected at different times and places, by using various methods, tools and techniques.
Teachers select the methods, tools and techniques used on the basis of

- the purpose of assessment
- the specific learning area
- what the teacher wants to assess: knowledge, skills, values and attitudes.

Assessment should make a meaningful contribution to learning and teaching. When we assess learners, we should convey to our learners that what matters most is not so much passing (success) or failing, but what can we learn from the past to improve future learning. Constructive assessment therefore requires a commitment to quality information and quality communication. Assessment must incorporate a sufficient range of methods, tools and techniques to meet the teacher's obligations. In particular, such assessment must attend to language, tools, level of sophistication, task type, context and communication mode. No single task or practice can adequately cover all these dimensions.

Let us now turn our attention to educational assessment. In educational assessment our objective is not simply to measure what learners have achieved, but to help them learn and achieve more. Educational assessment is part of the process of learning, not a separate process. If you restrict your view of assessment to tests, quizzes, projects, etc., you are missing the point that assessment can help learners to grow and that it can inform instruction.

Let us now systematically analyse the question: “What is assessment?”

The definition of assessment as stated in the Assessment standards for school mathematics by the National Council of Teachers of Mathematics in the United States (NCTM) (1995:3) is: ‘Assessment is defined as the process of gathering evidence about a student's knowledge of, ability to use, and disposition towards, mathematics and of making inferences from that evidence for a variety of purposes.’

The focus on gathering evidence and making inferences indicates that assessment is a process of uncovering what mathematics learners know and can do.

The phases of assessment

The assessment process can be explained in terms of four interrelated phases that highlight the principal points at which critical decisions need to be made in the assessment process.

The following are the four phases:

1. Plan the assessment.
2. Gather the evidence.
3. Interpret the evidence.
4. Use the results.
In practice, the four phases outlined above are interrelated and the distinctions between them are blurred. Assessment does not always proceed in a neat, linear fashion. Each phase can be characterised by the decisions and actions taken within that particular phase.

1 **Plan the assessment**

   The following are important during this phase:
   - Assessment must be planned on the basis of the outcomes expected of the learner.
   - The teacher must decide on the purpose served by the assessment.
   - The teacher must decide on the methods that are going to be used for gathering and interpreting evidence.
   - The teacher must decide on the criteria to be used for evaluating performance.

2 **Gather the evidence**

   The teacher must decide on how
   - activities and tasks are to be created or selected
   - procedures are to be selected to engage learners in the activities

3 **Interpret the evidence**

   The teacher must decide on how
   - to determine quality of the evidence
   - to infer an understanding of the performance from the evidence
   - to apply the criteria appropriately
   - to summarise the evaluation in terms of results

4 **Use the results**

   The teacher must decide on how
   - to report the results
   - to make inferences from the results
   - what action to take based on the inferences made.

In this section we are looking at how the assessment will be done in the planning and gathering of evidence. When we begin to talk about assessment tools, we are also starting to answer the question of how to interpret the evidence, which will lead us into the discussion of criteria.
Assessment methods, tools and techniques

There is a wide range of assessment methods, tools and techniques available to teachers. In order to assist you to decide on which methods, tools and techniques are most appropriate and useful in a particular learning situation, you need to understand the various criteria in terms of best practice.

Most curriculum packages and teachers organise their lessons around mathematical content. When the mathematics curriculum is organised into content-specific topics, assessment is similarly structured to document appropriate performances within the range of appropriate performances for the different content categories. This can be restrictive and there is a need for mathematics curricula and assessment to represent a model of varied mathematical activity.

It must be remembered that most assessment questions in mathematics are content-specific and must therefore be open enough to allow most learners to show what they know and have grasped (e.g. problem solving, reasoning, understanding, etc.).

The choice of what assessment methods, tools and techniques to use is a subjective one, that is, it is

- unique to each teacher, grade and school
- dependent on the teacher's professional judgment
- dependent on the specific learning area.

The assessment methods chosen must take into account

- the learning outcomes (LOs) and the assessment standards (ASs) of the learning area
- the purpose of assessment.

Therefore, the teacher should consider using a variety of methods to allow the learners to demonstrate their abilities. The chosen methods, tools and techniques must provide a range of opportunities for learners to demonstrate their achievement of knowledge, skills, values and attitudes. In selecting and setting appropriate assessment activities, the teacher should ask the following questions:

- What concept, skill or knowledge am I trying to assess?
- What type of knowledge is being assessed - reasoning, memory or process?
- At what level should the learners be performing?

The chosen methods, tools and techniques must provide a range of opportunities for learners to demonstrate their achievement of knowledge, skills, values and attitudes. The following table gives a list of possibilities,
but although it looks long, it is not fully inclusive of all of the possible methods, tools and techniques you may use as a teacher of mathematics.

Methods of assessment

The most important thing to consider when choosing an assessment method is to link the method with what you are intending to assess and why you want to assess it. In this section, we give examples of a number of methods of assessment and ask you to reflect on whether they are ‘fit for purpose’.

Self assessment

On the next page is an example of a self-assessment form.
### Self assessment form

<table>
<thead>
<tr>
<th>Name: ..................................................................................</th>
<th>Class: .........................</th>
</tr>
</thead>
<tbody>
<tr>
<td>Teacher: ...............................................................................</td>
<td>Date: .........................</td>
</tr>
<tr>
<td>Learning area: ........................................................................</td>
<td></td>
</tr>
</tbody>
</table>

Write down the two most important things you have learned in mathematics during the past month.

............................................................................................................................

What would you like more help with?

............................................................................................................................

How would you best describe how you feel in mathematics classes at the moment? (Circle the words that apply to you.)

(a) interested  (b) relaxed  (c) worried
(d) successful  (e) confused  (f) clever
(g) happy  (h) bored  (i) rushed

What is the biggest problem that you are currently facing in mathematics?

............................................................................................................................

(adapted from Clarke: 1997)
### Activity 8

1. Which of the following purposes are appropriate for self assessment? Circle the ones that you think are important. You should be able to explain your choices.

- Learners are guided to assess their own performance or work.
- Self-assessment encourages learners to assume more responsibility for their own learning and work.
- Self-assessment helps learners to think critically about their own work.
- Self-assessment gives learners a good idea of their progress.
- Teachers find out what learners value in their own work.
- Self assessment promotes the development of independent learners who will be well placed to access learning opportunities throughout their lives.
- Learners come to appreciate and know their own work.
- Self-assessment develops learners' confidence.
- Learners become aware of their strengths and weaknesses.

2. When would you use self assessment in your mathematics class?

3. How would you use the results of self assessment from a mathematics lesson?
Peer or group assessment

Here is an example of a peer assessment form.

### Peer or group assessment form

<table>
<thead>
<tr>
<th>Competence (criteria)</th>
<th>Yes</th>
<th>No</th>
<th>Uncertain</th>
</tr>
</thead>
<tbody>
<tr>
<td>Did the learner work in the team?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did the learner listen to the peer group discussion?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did the learner work with confidence?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Did the learner in the group show competence in his or her logical thought processes to formulate, test and justify?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Does the learner know and use mathematical language?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can the learner read the data accurately?</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Who does this form of assessment benefit?**

**In what way does the assessment benefit them?**

**What different types of group assessment have you used in your mathematics classes? Which of these were the most successful and why do you think this was the case?**
Observation

Here is an example of an observation sheet.

Observation sheet for Grade 4 lesson on data handling

<table>
<thead>
<tr>
<th>Criteria</th>

</tr>
<tr>
<td>8 Able to justify or explain work when questioned.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Activity 10

1 Which of the criteria in the observation sheet above relate to content issues?
2 Which of the criteria in the observation sheet above relate to problem-solving skills?
3 What are some of the valuable contributions that observation can make to assessment?
4 How could you adapt the observation sheet above to make it possible to use the sheet for a whole class? Draw up the sheet with the names of the learners in your class.
5 Compare the usefulness of an individual observation sheet with a whole class observation sheet indicating strengths and weaknesses of both types of sheet.
Performance-based tasks

Performance-based tasks should provide the opportunity for all learners to demonstrate at least some knowledge or skill, though this might be at different levels. Performance-based assessment looks at the learners' abilities to use their knowledge and skills to produce things like:

- presentations
- research projects
- investigations
- demonstrations or exhibitions
- drawings or graphs
- games or designs
- models.

This type of assessment requires learners to demonstrate a skill or proficiency in creating or doing something, often in a setting that involves real life applications. The teacher should not only assess the end product but also the process used by the learners to complete the task. This method of assessment is very useful in diverse classrooms, since it takes into consideration the process as well as the product. The teacher needs to keep careful records of observations made during the completion of the task, so that the assessment is not simply reduced to the assessment of the final product.

### Performance-based task

You are going to find out about the different forms of transport learners use to come to school.

Draw up a list of questions that you can use to find out which different forms of transport are used by the learners in your class. (You should include at least four different means of transport on your list.)

1. Ask all of the learners in your class which form of transport they use, and draw up a tally table of their responses.
2. Find the frequencies from your tally table.
3. Represent your data using a bar graph or a pictogram.
4. What does your graph tell you about the forms of transport used by the learners in your class?
5. Could you use this information to decide about the forms of transport used by the learners in your school? Explain your answer.
Activity 11

Use the following check list to evaluate the design of the performance-based task above. In each case explain your answer and suggest improvements where necessary.

1. Does the task require an integration of knowledge, skills and values?
2. Does it require a variety of outcomes?
3. Is the task based on a real life context?
4. Is the task practical enough to be done? (do-able)
5. Are multiple solutions possible?
6. Is the nature of the task clear?
7. Is the task challenging and stimulating to the learners?
8. Are criteria for scoring included?

(DOE: Curriculum 2005 Assessment Guidelines)

Tools for assessment

A tool is any instrument that you use in your assessment, such as

- a portfolio
- an observation sheet
- a journal
- a questionnaire
- a test.

In this section we will only discuss portfolios, though you may wish to research some of the other tools mentioned in the list above.

Portfolios

A portfolio can be described as a collection of samples of a learner's work that shows how the learner has developed over time through the learning process. In mathematics, portfolios offer learners the opportunity to demonstrate the evolution of their mathematical knowledge and performance over particular period of time. During this process of collecting items, learners make decisions about what items to put in their portfolios, and it is this decision-making process that builds learner involvement.

Portfolio collections may include input by

- learners
- teachers
- parent/s
- peers
Portfolios should reflect the learner's actual day-to-day learning activities. They should be a measure of where the learners were and what they have accomplished. Portfolios should be ongoing to show-case the learner's efforts, progress and achievements over time. The selected works may be in a variety of media and multidimensional.

In their document on assessment standards, the National Council of Teachers of Mathematics suggests that mathematics portfolios be organised in exhibits that have focused purposes and clear criteria for judgement.

Here is an example (Clarke:1997):

<table>
<thead>
<tr>
<th>Exhibit</th>
<th>Purpose and criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conceptual understanding</td>
<td>Use conceptual understanding to solve problems and represent the concept in multiple ways (through numbers, graphs, symbols, diagrams or words).</td>
</tr>
<tr>
<td>Problem solving</td>
<td>Using mathematical concepts and skills to solve non-routine problems that do not lay out specific and detailed steps to follow.</td>
</tr>
<tr>
<td>Putting mathematics to work</td>
<td>Type of investigations:</td>
</tr>
<tr>
<td></td>
<td>- data study</td>
</tr>
<tr>
<td></td>
<td>- design a physical structure</td>
</tr>
<tr>
<td></td>
<td>- pure mathematics investigation</td>
</tr>
<tr>
<td>Skills and communication</td>
<td>Lists of skills and communications are presented on the entry slips.</td>
</tr>
</tbody>
</table>

**Assembling a portfolio**

Learners must be guided on how to review all the work done so far and then select a few examples of the best work for inclusion in the portfolio. Before including a particular document (example), the learner should ask the following questions:

- What is this piece about?
- What makes this piece representative of my best work?
- What mathematics did I learn or apply in this piece?
Stages in the creation and design of a portfolio

- **COLLECTION**: The teacher and learner must reach prior agreement on
  - what samples and exhibits are to be included
  - how many of the above may be included
  - compiling procedures

- **SELECTION**: Samples to be selected must conform with the criteria set at the outset.

- **REFLECTION**: The teacher should encourage and support the learner to reflect on what the portfolio shows about his or her learning.

- **ASSESSMENT**: The portfolio must be formally assessed according to pre-determined criteria.

The benefits and value of using portfolios for assessment

The portfolio offers

- a broader, more in-depth look at what learners know and can do
- the opportunity to assess more ‘authentic’ work
- a supplement or alternative to report cards and formal tests
- a better way to communicate learner progress to parents.

How do you assess a portfolio?

The following questions can be used to guide you in assessing a portfolio:

- Does the portfolio show the learner's growth and development over time?
- Does the portfolio show evidence of the process of planning and creating, as well as the final product?
- Does the portfolio show evidence of thoughtful reflection by the learner on his or her learning and achievement?
- Does the portfolio show collected work of an acceptable quality?
- Is the portfolio varied to show achievement through differing pieces of work?
- Does the portfolio communicate the learner's achievements clearly, effectively and convincingly?
### Sample of a portfolio assessment sheet *(Adapted from Kramer: 1999)*

<table>
<thead>
<tr>
<th>Assessment criteria</th>
<th>Very good</th>
<th>Good</th>
<th>Satisfactory</th>
<th>Poor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evidence of mastery of the concepts</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Evidence of process:</td>

<tr>
<td>Self-reflection: Honest personal commentary, highlighting of areas of excellence and issues for improvement</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Explanation: Justifies and explains each sample included</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The assessment sheet above is a simple rubric with criteria in the first column, and then four columns in which to indicate the standard of the work achieved by the learner in relation to each of the criteria.

### Activity 12

1. Take some time to reflect on the purpose of a portfolio in assessment.
2. The rubric above would be even more useful to the learners if the criteria were explained in more detail in each of the columns of the table. Copy the rubric onto a sheet of paper and write in the detail so that a learner would know exactly what was expected of him/her in order to achieve at each of the levels.
Rubrics

The rubric given for the portfolio assessment above is an appropriate assessment tool, since it lays out clear criteria on which learners’ portfolios will be assessed. The fully expanded rubric (which you had to complete for the activity) would be even more successful, since this would make it completely clear to a learner why he/she achieved the given ratings.

Assessment tasks cannot be effectively evaluated simply by adding up all the correct answers, or awarding a quantitative mark (say 60%). Such a mark gives no information to the learner on what, in particular, was good or bad about his or her work. We need to find ways to manage this information and make it useful. One very useful tool with which to do so is a rubric. Rubrics are rating scales that are used in the assessment of performance. They are formally defined as scoring guides, consisting of pre-established performance criteria, and are used in evaluating or assessing a learner's performance. The expansions of the criteria at the different levels are called level descriptors.

On the next page is an example of a learner friendly mathematics rubric.

---

### Activity 13

1. For this question, refer to the **six point analytic rubric** on the next page.
   - Which column/row in the rubric sets out the criteria which are being assessed?
   - Which column/row in the rubric sets out the levels of the criteria which are being assessed?

2. Set a task (such as the performance task given in activity 11 in this unit) and allow your learners to work through the task. Write up the statement of the task in full.
   - Design a rubric, using all or some of the criteria and level descriptors that you will use to assess the learners’ work.
   - Assess your learners’ work using the rubric.
   - Comment on the success/failure of the assessment, and on the learners’ responses to their work being evaluated in this way.

3. Draw up a project assessment task on any topic from space and shape (LO3) for a grade of your choice.
   - Indicate the grade on the task. Write out the task in full.
   - Draw up a rubric that you will use to assess your learners’ projects.

4. Discuss the value of using a rubric as opposed to a memorandum for a task such as a project, compared to a task such as an activity worksheet.
### Six-point analytic rubric for assessing mathematics problem solving

<table>
<thead>
<tr>
<th></th>
<th>Understanding</th>
<th>Support for Thinking</th>
<th>Communication</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Outstanding</strong></td>
<td>▪ Finds all important parts of the problem</td>
<td>▪ Finds more than one way to solve the problem</td>
<td>▪ Writes a clear, convincing, thoughtful answer</td>
</tr>
<tr>
<td>6</td>
<td>▪ Has full understanding of mathematics needed</td>
<td>▪ Uses many ways to show thinking like diagrams, charts, graphs, etc</td>
<td>▪ Writes to an audience</td>
</tr>
<tr>
<td>(Exceptional – goes beyond what was asked)</td>
<td>▪ Uses unusual, creative thinking</td>
<td>▪ Learner experiments, designs, analyses</td>
<td>▪ Diagrams are very clear</td>
</tr>
<tr>
<td><strong>Meritorious</strong></td>
<td>▪ Finds most of the important parts of the problem</td>
<td>▪ Finds one or more ways to solve problem</td>
<td>▪ Writes clearly</td>
</tr>
<tr>
<td>5</td>
<td>▪ Has good understanding of mathematics needed</td>
<td>▪ Uses several ways to show thinking like diagrams, charts, graphs, etc.</td>
<td>▪ Makes sense</td>
</tr>
<tr>
<td>(Very good, clear, strong)</td>
<td>▪ May experiment, design, analyse</td>
<td>▪ May compare the problem to another, predict</td>
<td>▪ Writes to an audience</td>
</tr>
<tr>
<td><strong>Satisfactory</strong></td>
<td>▪ Finds most of the important parts of the problem – some less important are missing</td>
<td>▪ Uses one way to solve problem</td>
<td>▪ Addresses all parts of the problem</td>
</tr>
<tr>
<td>4</td>
<td>▪ Understands most of the mathematics needed</td>
<td>▪ Some ways to show thinking may be missing</td>
<td>▪ Writes to an audience</td>
</tr>
<tr>
<td>(Pretty good, gets the job done)</td>
<td>▪ May experiment, design or analyse</td>
<td>▪ May experiment, design or analyse</td>
<td>▪ Writing may be unclear</td>
</tr>
<tr>
<td><strong>Adequate</strong></td>
<td>▪ Finds a few of the important parts of the problem</td>
<td>▪ May or may not solve the problem</td>
<td>▪ Has trouble writing ideas</td>
</tr>
<tr>
<td>3</td>
<td>▪ Understands some of the mathematics needed</td>
<td>▪ Mathematical thinking is unclear or limited</td>
<td>▪ May or may not write to an audience</td>
</tr>
<tr>
<td>(OK, good try, unclear)</td>
<td>▪ Thinking gets mixed up</td>
<td>▪ Chooses wrong ways to solve problem</td>
<td>▪ Diagrams or charts not clear</td>
</tr>
</tbody>
</table>
### Six-point analytic rubric for assessing mathematics problem solving

<table>
<thead>
<tr>
<th></th>

</table>
Checklists and rubrics

The example of a learner friendly mathematics rubric above is very general, and you may use it to help you draw up rubrics for activities and tasks that you set for your learners. We now include a checklist and a rubric, relating to two mathematics activities, given below. These should help you to see the differences between rubrics and checklists, and to decide when to use these in your teaching.

First, we’ll draw up a checklist for the following activity, from Unit Two:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>In the number 10 212 the 2 on the left is _____________ times the 2 on the right.</td>
</tr>
<tr>
<td>2</td>
<td>In the number 10 212 the 1 on the left is _____________ times the 1 on the right.</td>
</tr>
<tr>
<td>3</td>
<td>In the number 80 777 the 7 on the far left is _____________ times the 7 immediately to the right of it.</td>
</tr>
<tr>
<td>4</td>
<td>In the number 80 777 the 7 on the far left is _____________ times the 7 on the far right.</td>
</tr>
<tr>
<td>5</td>
<td>In the number 566 the 6 on the right is _____________ times the 6 on the left.</td>
</tr>
<tr>
<td>6</td>
<td>In the number 202 the 2 on the right is _____________ times the 2 on the left.</td>
</tr>
<tr>
<td>7</td>
<td>In the number 1 011 the 1 on the far right is _____________ times the 1 on the far left.</td>
</tr>
<tr>
<td>8</td>
<td>In the number 387, the face values of the digits are ______, ______ and ______; the place value of the digits (from left to right) are ____________ and ____________; and the total values represented by the digits (from left to right) are ______, ______ and ______.</td>
</tr>
</tbody>
</table>

The maths in the task

In order to successfully complete the activity, a learner would need to have a well-established place value concept, and be able to work with place value in up to 5-digit numbers. Using this understanding of place value, they will be able to identify relationships between numbers which are multiples of each other. The multiples they need to identify involve both whole numbers (in tens, hundreds and so on) and fractions; (in tenths, hundredths and so on). Numbers 1-4 involve whole number multiple relationships and numbers 5-8 involve fractional multiple relationships.
## Checklist for use in class evaluation of place value activity

<table>
<thead>
<tr>
<th>Learner Name</th>
<th>Criteria</th>
<th>Yes</th>
<th>No</th>
<th>Partial</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Able to identify whole number multiple relationships (in tens, hundreds and so on) between digits.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Able to identify fraction number multiple relationships (in tenths, hundredths and so on) between digits.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Learner understands the language used to describe the position of the digits in relation to each other (left, far left, right, far right).</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Learner has understood place value concept, and be able to work with place value in up to 5-digit numbers.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Now we’ll draw up a rubric for the following activity, from Unit Four:
Activity 15

See Activity 5, number 2 [from Unit Four]

Organise your class into groups of 3 or 4. The groups are going to investigate some 3D objects. Each member of the group will construct one 3D shape. The group members will then count the number of the edges, the faces and the vertices (corners) of each shape. You, the teacher will provide the nets for the learners by enlarging the nets on the next page. You might need to assist the learners to construct the shapes.

The learners then complete the table below.

<table>
<thead>
<tr>
<th>Shape</th>
<th>Name</th>
<th>No. of vertices</th>
<th>No. of edges</th>
<th>No. of faces</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>B</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>D</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>E</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The maths in the task

In order to successfully complete this task, the learners need to be able to make models of the set shapes. The nets provided will enable them to build a cube, a cuboid (rectangular prism), a triangular prism, a triangular pyramid (tetrahedron) and a square pyramid. According to the instructions of the task, you will have given the learners the nets for these shapes, but not the names. The nets should be labelled A, B, C, D and E. The learners will have to identify the names of each of the shapes, and write them in the correct row, according to the given letters. The learners then need to be able to count the number of faces, edges and vertices of the polyhedra that they build.

Group work nature of this task

According to the instructions given for this task, the learners had to work in groups, and complete it as a group work activity. Provision for this will also have to be made in the rubric, as you will see below.
<table>
<thead>
<tr>
<th>Criteria</th>
<th>Outstanding</th>
<th>Achieved</th>
<th>Partially Achieved</th>
<th>Not Achieved</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model making</td>
<td>The shapes that the learner has made are all accurately cut, folded and pasted. All edges perfectly folded and matched when pasted.</td>
<td>The shapes that the learner has made are well cut, folded and pasted, but edges are not quite straight, and some are not perfectly matched.</td>
<td>Shapes are not very accurately cut and many folds not straight. Flaps not all well matched when pasted, so that not all shapes are perfect models.</td>
<td>Shapes not very accurately cut and folds not neatly made along all edge lines. Not all nets have been cut and made into the required 3D models, work is incomplete.</td>
</tr>
<tr>
<td>Naming of shapes</td>
<td>The learner is able to name all of the shapes correctly.</td>
<td>The learner is able to name at least 3 of the 5 shapes correctly.</td>
<td>The learner is able to name one or two of the shapes correctly.</td>
<td>The learner is not able to name any of the shapes correctly.</td>
</tr>
<tr>
<td>Able to count faces</td>
<td>The number of faces of all 5 of the shapes has been correctly counted and recorded.</td>
<td>The number of faces of at least 4 of the shapes has been correctly counted and recorded.</td>
<td>The number of faces of at least 2 of the shapes has been correctly counted and recorded.</td>
<td>The number of faces of only one (or none) of the shapes has been correctly counted and recorded.</td>
</tr>
<tr>
<td>Able to count vertices</td>
<td>The number of vertices of all 5 of the shapes has been correctly counted and recorded.</td>
<td>The number of vertices of at least 4 of the shapes has been correctly counted and recorded.</td>
<td>The number of vertices of at least 2 of the shapes has been correctly counted and recorded.</td>
<td>The number of vertices of only one (or none) of the shapes has been correctly counted and recorded.</td>
</tr>
<tr>
<td>Able to count edges</td>
<td>The number of edges of all 5 of the shapes has been correctly counted and recorded.</td>
<td>The number of edges of at least 4 of the shapes has been correctly counted and recorded.</td>
<td>The number of edges of at least 2 of the shapes has been correctly counted and recorded.</td>
<td>The number of edges of only one (or none) of the shapes has been correctly counted and recorded.</td>
</tr>
<tr>
<td>Able to work as part of a group</td>
<td>Took responsibility for shapes allocated to him/her. Participated actively in the group discussion.</td>
<td>Took responsibility for shapes allocated to him/her. Participated in the group discussion, though slightly distracted.</td>
<td>Was reluctant to make shapes allocated to him/her. Wanted others to do the work. Participated only in part in the group discussion.</td>
<td>Did not make shapes allocated to him/her properly. Distracted and did not participate in group discussion.</td>
</tr>
</tbody>
</table>

As you will have noticed from the above two examples, it takes much more effort to draw up a rubric, which has to have descriptors in every cell of the table, than it takes to draw up a checklist.
Checklists are useful when you want to assess whether a number of concepts have been understood (or not), whether tasks have been completed or not. They are also useful if you want an individual record of each learner’s achievement on a task that you can use for further planning on the topic which has been taught in the lesson in which this task was completed. They provide you with a record that you can use for your planning, and individual tracking of a learner’s understanding of concepts covered.

Rubrics are useful when you want to give very clear instructions at the outset of a task. If the learners are given a rubric, according to which they will be assessed, they will know what kind of performance is expected of them before they start on a task. This means that you need to draw up a rubric before you set the task for the class. It also means that you can give clear and detailed feedback to the learners when you indicate to them where their achievement has been recorded according to the cells in the rubric. This example provides us with a link to our next set of questions: how do we interpret and report assessment?
How to interpret the results of assessment?

Rubrics are one of the forms of interpretation for an assessment task. Rubrics are time consuming to draw up, but facilitate the reporting process on an assessment task since they present a good overview of the learners’ achievement on the completed task. All assessment, ultimately, needs to be interpreted and reported on. The reports will not only go to the learner who completed the assessment but potentially to other interested parties, and thus the interpretations on which these reports are based are important and need to be carefully considered so that the reporting can be fair and representative of the work done.

Three points of reference

The following are the three points of reference that can be used in educational assessment.

Self-referencing

Self-referencing could be used by the teacher to help learners plot their own development without this being downgraded (or over-rated) in comparison to the achievements of other learners. In the case of self-referencing, the learner

- is the reference point for his or her own achievement
- compares his or her achievement to what he or she has done before
- sets targets for the tasks he or she has to do, depending upon his or her previous achievements.

Example: The parent or teacher may criticise the learner for getting poor marks for a test. However, the learner may draw their attention to the fact that he or she has improved on his or her previous test. In this case, the learner is self-referencing.

Criterion-referencing

Criteria are used as reference points in OBE. The criteria are the learning outcomes (LOs) and the assessment standards (ASs). These criteria are used to

- ascertain the learner's progress in terms of learning outcomes and assessment standards, which are independent of other learners' achievements
- give every learner a fair and equal opportunity to achieve or master the outcomes
• bring learners into the assessment process because the learners might take part in the process of drawing up the criteria, or will at least be aware of the criteria before attempting to do the task, so they will know what to spend time on when completing the task

• the assessment criteria are explicit, and so the learners will understand how their work is being assessed

• the explicit nature of the criteria will also enable the teacher to justify the assessment more easily and clearly to the learners and other interested parties

• move away from an assessment system which is primarily designed to create a comparison between all learners’ achievements to one designed to credit achievement at different levels.

**Example:** When learners are given a task to do, they are also given the criteria on the basis of which the task will be assessed. From the beginning, they are aware of what criteria they have to meet and how they will be assessed.

**Norm-referencing**

Norm-referencing is useful as a tool for things such as university entrance rating. The norm-referenced results can be used to decide whether or not a learner has achieved sufficiently well (against the given norm) to be allowed into the different faculties of the University. In terms of norm-referencing

• learners’ progress is described in relation to standards set for a group (such as a class average)

• learners’ progress is also defined in terms of other individuals in the class and then inferences are made about how much a learner has learnt in comparison with others

• learner achievement is assessed in a competitive way

• results are often given as a mark or a symbol which give a picture of the learners’ overall achievement, for example by means of NSC examinations all grade 12 learners are rated in comparison to a national standard and in relation to individual achievement against this standard.

• standardised tests are often used to measure learner achievement.

Pegg (2002: 235) writes that traditional assessment can mostly be referred to as ‘norm-referenced’, while outcomes-based education is more ‘criterion-referenced’. While the main focus of these two approaches is different, they are not incompatible or in direct conflict. In fact, when determining appropriate criteria to evaluate levels of achievement in OBE, criteria are being defined within a norm-referenced context.
### Activity 16

Read the following statements made by teachers and then identify which statements illustrate norm-referencing, which illustrate criterion-referencing and which illustrate self-referencing, giving reasons for your response in each case.

**Teacher A**

Sipho has done well this term. He can calculate the area of flat surfaces, which he had difficulty with last term. He has made good progress.

**Teacher B**

I am worried about Mary. She doesn't seem to be able to work as fast as the other learners in my mathematics class. I think she is unable to do computation involving two or three digits.

**Teacher C**

My class seems to be doing okay. They're about as far into division as last year's class was at this time of year.

**Teacher D**

Ernest is a born mathematician. His spatial perception is outstanding. He is able to convert 2D drawings into simple 3D working models. He has a good grasp of perspective.

### How to report?

The ultimate success of a continuous assessment model rests on sound and meticulous methods of recording learner achievement over an ongoing period of time. Cumulative evidence of learner achievement must be recorded and these records should accompany all learners throughout their learning careers. Cumulative records should include information on the holistic development of the learner, such as his or her social development and the development of his or her values and attitudes.

Each school should develop an assessment programme based on national and provincial guidelines. To ensure a professional approach to assessment, the school assessment programme should clearly outline:

- the way continuous assessment is to be planned and implemented
- how record books are to be kept, their accessibility and security
- internal verification of assessment
- how moderation takes place in the school
- the frequency and method of reporting; and
- the monitoring of all assessment processes.

Activity 17

Study the two different report cards given below.

1. Discuss the differences and similarities between them.
2. Which report card would you prefer to use? Explain your answer.
3. Which report card do you think the learners would prefer to receive? Explain your answer.
4. Design a report card for the second term for the work you have covered in your mathematics class. (It need not look anything like the two examples below).
   i. Write it up and show it to a colleague.
   ii. Make changes to the report card according to your discussion with your colleague.
   iii. Show the report card to your learners. Write down their responses to its layout and information which it offers.
   iv. Show the report card to some parents of your learners. Write down their responses to its layout and information which it offers.
   v. Draw up a final version of the report card that you think would satisfy all of the stakeholders in the assessment process. Comment on how different it is from the first version you drew up.

<td></td>
</tr>
</tbody>
</table>
The control and ownership of assessment was traditionally in the hands of teachers, but since the implementation of outcomes-based education (OBE), the teacher and learner have shared responsibility to assess learning and knowledge.

Although in the first place it is the teacher's responsibility to assess and report on the progress of the learner, this does not imply that it is his or her sole responsibility. There are other stakeholders in the assessment process. These include the learner, other schools, district level managers and support services within the department, parents of the learner and the public at large. The teacher is accountable to all of these stakeholders and must ensure they he/she has effective means for reporting on and communicating to these stakeholders.
Self assessment

Tick the boxes to assess whether you have achieved the outcomes for this unit. If you cannot tick the boxes, you should go back and work through the relevant part in the unit again.

I am able to:

<table>
<thead>
